The history is provided by the EMS personnel and the spouse.

Brought to the emergency department after being found down by wife. Patient had hip replacement surgery done on Saturday and the wife reports that she was up with the husband until approximately 10:30 at night he told her that she should go to bed to be more comfortable because he was going to be sleeping in the recliner. She got up to use the restroom just prior to calling EMS and he looked like he was not breathing she approached him attempted CPR in the field and then called EMS. Upon arrival of EMS the patient was in asystole. Interosseous line was established by EMS patient was given epinephrine in the field and intubated. Last seen alive was at 10:30 at night

**Review of Systems****Unable to perform ROS: Intubated**

Skin: Negative.

All other systems reviewed and are negative.

Labs Reviewed - No data to display

**Procedures: None**

**ED Course, and Reassessment:**

Patient had established interosseous line. Upon arrival to the emergency department patient was placed on monitor was found to be in asystole second round of epinephrine and bicarb was given patient's blood sugar is 121 per EMS. Patient unknown length of time down last seen well was 1030 we have asystole for most likely extended period of time there is already lividity beginning to set in. Patient was pronounced dead please see nursing note for time of death family notified and wife notified in waiting room discussed. My typical discussions concerning death in the emergency department was given to wife and any family members present

Critical care time of 20 minutes was given to this patient which included time at the bedside, discussions with consultants, review of the chart, and lab studies. This critical care time does not include any billable procedures.
